

Solution Architecture

Date	26 June 2026
Team ID	SWTID-2026-8613
Project Name	Personalized Networking Assistant
Maximum Marks	5 Marks

Solution Architecture Diagram:

The user enters event details through the Streamlit frontend. The FastAPI backend processes the request and generates personalized conversation starters. The fact-check module verifies accuracy, while the SQLite database stores user data and history. Finally, the system returns a personalized, accurate, and reliable response with the event theme and conversation starters.

Component Description Table

Component Name	Description / Role in Architecture	Technologies Used
Presentation Layer	<i>Provides a user interface for entering event details and displaying themes and conversation starters via backend APIs."</i>	Streamlit
API Gateway/ Backend	<i>Receives frontend requests, validates input, manages workflow, calls AI modules, and returns processed results efficiently</i>	FastAPI, Uvicorn
Auth Service	<i>Authentication is currently unavailable and planned as a future feature for secure user access and login</i>	<i>Future Enhancement (JWT/OAuth2)</i>
Core Logic Service	<i>Handles core application logic, including conversation generation, fact-checking, history management, and AI processing tasks.</i>	Python, DistilBERT, GPT-2, conversation.py, factcheck.py, history.py, config.py
External API Integrations	Fetches event details from Wikipedia to enhance context, improve accuracy, and support networking responses.	Wikipedia API
Data / Storage Layer	Stores conversation history, event details, and app data, defining database models and API schemas.	SQLite (test_pns.db), database.py, schemas.py
